(a) Tail drift vs. denominator error (gauss, $n = 10^6$)
mAP stays blind:
< 2 mAP points moved
measured $\Delta \ln P_{fa}$
first-order $z^2\varepsilon_\sigma$
second-order correction
|ΔAUROC|
$\Delta \ln P_{fa}$ (log)
|ΔAUROC| (mAP proxy)
quantization error on null-model scale ε_σ
(b) Bound covers measured drift
gauss (6 levels)
t3 heavy-tail (6 levels)
all 12 levels below the line
bound_holds = true
y = x (bound active)
measured $|\Delta P_{fa}|$
Prop.2 bound $L\delta$ (from scale table)
